February 13, 2025

1 Bayesian Networks

1. Consider a simple Markov Chain structure $X \to Y \to Z$, where all variables are binary. You are required to:
   (a) Write a code (using your preferred programming language) that generates a distribution (not necessarily a valid BN one) over the 3 variables.

   [**in the notebook**]

   (b) Write a code that verifies whether a distribution is a valid BN distribution.

   [**in the notebook**]

   (c) Using your code, generate 10000 distributions and compute the fraction of distributions that are valid BN distributions.

   [**in the notebook**]

2. Given the following Bayesian Network

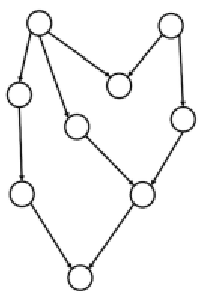

Figure 1: A Bayesian network.

Figure 1: Bayesian Network

   (a) Propose a topological ordering of this graph
   In Figure 2, the topological ordering is:
      i. $A \to B \to C \to D \to E \to F \to G \to H \to I$
      ii. $A \to B \to C \to E \to D \to F \to G \to I \to H$

   (b) Let $\mathbf{X}$ be a random vector that is Markov with respect to the graph. We assume that the random variables X, are binary. Write all the local conditional independence

X_A has no parents, so no independence condition applies here.

X_B has no parents, so no independence condition applies here.

X_C is conditionally independent of all other nodes given its parent $X_A X_B$:

$$X_C \perp \{X_D, X_E, X_F, X_G, X_H, X_I\} \mid \{X_A.X_C\}$$

X_D is conditionally independent of all other nodes given its parent X_A :

$$X_D \perp \{X_B, X_C, X_E, X_F, X_G, X_H, X_I\} \mid X_A$$

X_E is conditionally independent of all other nodes given its parents X_C and X_D :

$$X_E \perp \{X_B, X_C, X_D, X_F, X_G, X_H, X_I\} \mid X_A$$

X_F is conditionally independent of all other nodes given its parent X_B :

$$X_F \perp \{X_A, X_C, X_D, X_E, X_G, X_H, X_I\} \mid X_B$$

X_G is conditionally independent of all other nodes given its parents X_E and X_F :

$$X_G \perp \{X_A, X_B, X_C, X_D, X_H, X_I\} \mid \{X_E, X_F\}$$

X_H is conditionally independent of all other nodes given its parent X_D :

$$X_H \perp \{X_A, X_B, X_C, X_E, X_F, X_G, X_I\} \mid X_D$$

X_I is conditionally independent of all other nodes given its parents X_G and X_H :

$$X_I \perp \{X_A, X_B, X_C, X_D, X_E, X_F\} \mid \{X_G, X_H\}$$

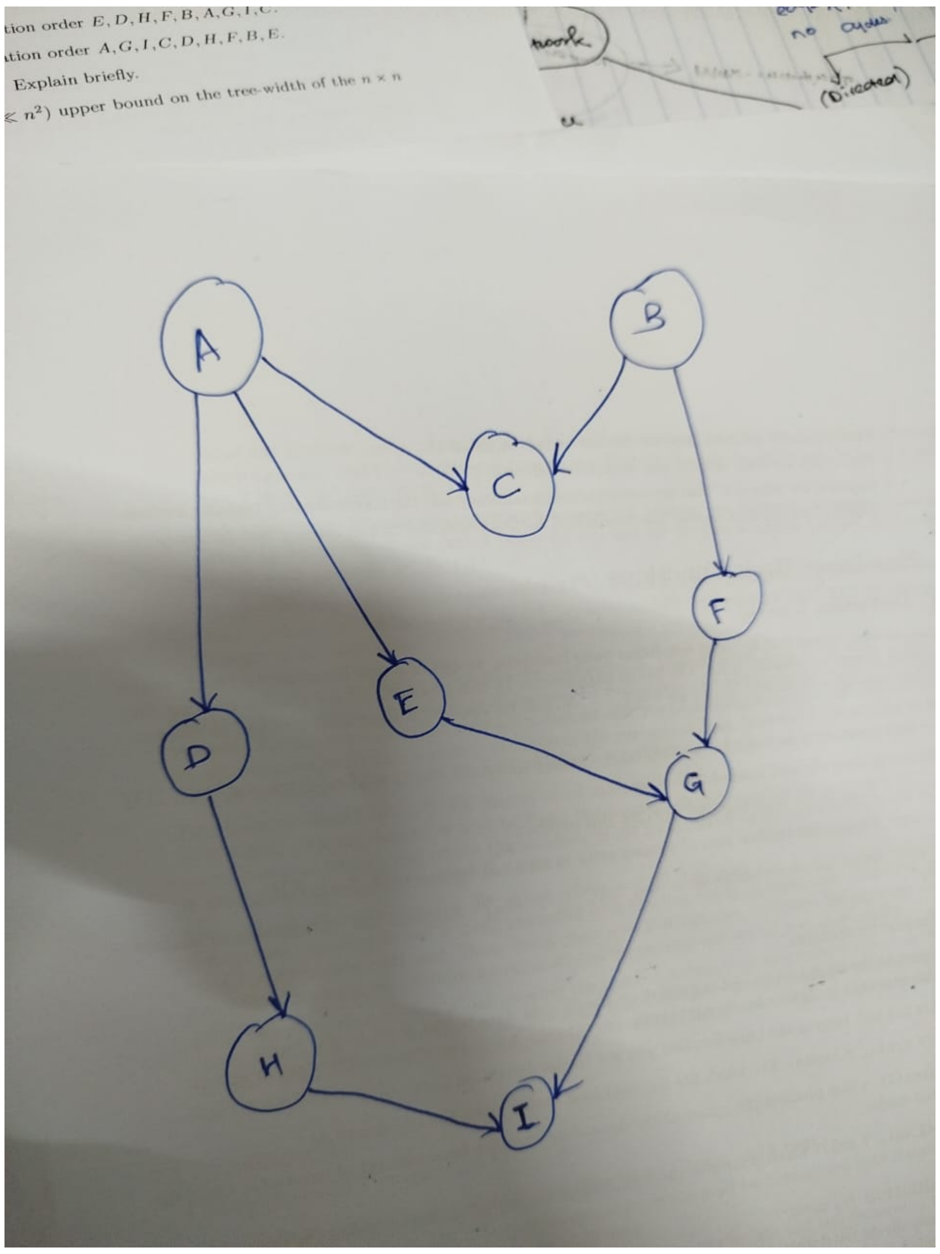

Figure 2: Bayesian Network

3. State True or False, and briefly justify your answer within 3 lines. The statements are either direct consequences of theorems in Koller and Friedman (2009, Ch. 3), or have a short proof. In the follows, P is a distribution and G is a BN structure.

   (a) If $A \perp B \mid C$ and $A \perp C \mid B$, then $A \perp B$ and $A \perp C$. (Suppose the joint distribution of A, B, C is positive.) (This is a general probability question not related to BNs.)

   - **False**. Whilst local independence implies global independence, global independence does not imply local independence.

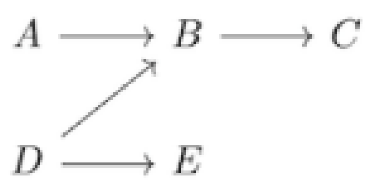

Figure 2: A Bayesian network.

Figure 3: Bayesian Network

   (b) In Figure 2, $E \perp C \mid B$
   True. The path from E to C is blocked by the node B, so E is conditionally independent of C given B.

   (c) in Figure 2, $A \perp E \mid C$
   False. A is not conditionally independent of E given C because there is a path from A to E that is not blocked by C.

2 Markov Networks

Let $\mathbf{X} = (X_1, \ldots, X_d)$ be a random vector with mean $\boldsymbol{\mu}$ and covariance matrix $\boldsymbol{\Sigma}$. The partial correlation matrix $\mathbf{R}$ of $\mathbf{X}$ is a $d \times d$ matrix where each entry $R_{ij} = \rho(X_i, X_j \mid \mathbf{X}_{-ij})$ is the partial correlation between X_i and X_j given the $d-2$ remaining variables $\mathbf{X}_{-ij}$. Let $\boldsymbol{\Theta} = \boldsymbol{\Sigma}^{-1}$ be the inverse covariance matrix of $\mathbf{X}$.

We will prove the relation between $\mathbf{R}$ and $\boldsymbol{\Theta}$, and furthermore how $\boldsymbol{\Theta}$ characterizes conditional independence in Gaussian graphical models.

$$\begin{pmatrix} \Theta_{ii} & \Theta_{ij} \\ \Theta_{ji} & \Theta_{jj} \end{pmatrix} = \begin{pmatrix} \mathrm{Var}[e_i] & \mathrm{Cov}[e_i, e_j] \\ \mathrm{Cov}[e_i, e_j] & \mathrm{Var}[e_j] \end{pmatrix}^{-1}$$

for any $i, j \in [d], i \neq j$. Here e_i is the residual resulting from the linear regression of X_{-ij} to X_i, and similarly e_j is the residual resulting from the linear regression of X_{-ij} to X_j.

1. (10 points) Show that

$$R_{ij} = -\frac{\Theta_{ij}}{\sqrt{\Theta_{ii}\Theta_{jj}}}$$

We start from the given matrix equation:

$$\begin{pmatrix} \Theta_{ii} & \Theta_{ij} \\ \Theta_{ji} & \Theta_{jj} \end{pmatrix} = \begin{pmatrix} \mathrm{Var}[e_i] & \mathrm{Cov}[e_i, e_j] \\ \mathrm{Cov}[e_i, e_j] & \mathrm{Var}[e_j] \end{pmatrix}^{-1}.$$

let us find the determinant of th matrix on the right hand side:

$$\det \begin{pmatrix} \mathrm{Var}[e_i] & \mathrm{Cov}[e_i, e_j] \\ \mathrm{Cov}[e_i, e_j] & \mathrm{Var}[e_j] \end{pmatrix} = \mathrm{Var}[e_i]\mathrm{Var}[e_j] - \mathrm{Cov}[e_i, e_j]^2.$$

Using the determinant, let us find the inverse of the matrix on the right hand side:

$$\frac{1}{\mathrm{Var}[e_i]\mathrm{Var}[e_j] - \mathrm{Cov}[e_i, e_j]^2.} \begin{pmatrix} \mathrm{Var}[e_j] & -\mathrm{Cov}[e_i, e_j] \\ -\mathrm{Cov}[e_i, e_j] & \mathrm{Var}[e_i] \end{pmatrix}$$

Let us push the determinant into the matrix:

$$\begin{pmatrix} \frac{\mathrm{Var}[e_j]}{\mathrm{Var}[e_i]\mathrm{Var}[e_j] - \mathrm{Cov}[e_i, e_j]^2} & -\frac{\mathrm{Cov}[e_i, e_j]}{\mathrm{Var}[e_i]\mathrm{Var}[e_j] - \mathrm{Cov}[e_i, e_j]^2} \\ -\frac{\mathrm{Cov}[e_i, e_j]}{\mathrm{Var}[e_i]\mathrm{Var}[e_j] - \mathrm{Cov}[e_i, e_j]^2} & \frac{\mathrm{Var}[e_i]}{\mathrm{Var}[e_i]\mathrm{Var}[e_j] - \mathrm{Cov}[e_i, e_j]^2} \end{pmatrix}$$

We can now equate the two matrices:

$$\begin{pmatrix} \Theta_{ii} & \Theta_{ij} \\ \Theta_{ji} & \Theta_{jj} \end{pmatrix} = \begin{pmatrix} \frac{\mathrm{Var}[e_j]}{\mathrm{Var}[e_i]\mathrm{Var}[e_j] - \mathrm{Cov}[e_i, e_j]^2} & -\frac{\mathrm{Cov}[e_i, e_j]}{\mathrm{Var}[e_i]\mathrm{Var}[e_j] - \mathrm{Cov}[e_i, e_j]^2} \\ -\frac{\mathrm{Cov}[e_i, e_j]}{\mathrm{Var}[e_i]\mathrm{Var}[e_j] - \mathrm{Cov}[e_i, e_j]^2} & \frac{\mathrm{Var}[e_i]}{\mathrm{Var}[e_i]\mathrm{Var}[e_j] - \mathrm{Cov}[e_i, e_j]^2} \end{pmatrix}$$

To show that $R_{ij} = -\frac{\Theta_{ij}}{\sqrt{\Theta_{ii}\Theta_{jj}}}$, we need to show that:

$$R_{ij} = -\frac{\Theta_{ij}}{\sqrt{\Theta_{ii}\Theta_{jj}}}$$

$$R_{ij} = -\frac{-\frac{\mathrm{Cov}[e_i, e_j]}{\mathrm{Var}[e_i]\mathrm{Var}[e_j] - \mathrm{Cov}[e_i, e_j]^2}}{\sqrt{\frac{\mathrm{Var}[e_i]}{\mathrm{Var}[e_i]\mathrm{Var}[e_j] - \mathrm{Cov}[e_i, e_j]^2} \frac{\mathrm{Var}[e_j]}{\mathrm{Var}[e_i]\mathrm{Var}[e_j] - \mathrm{Cov}[e_i, e_j]^2}}}$$

$$R_{ij} = -\frac{-\frac{\mathrm{Cov}[e_i, e_j]}{\mathrm{Var}[e_i]\mathrm{Var}[e_j] - \mathrm{Cov}[e_i, e_j]^2}}{\sqrt{\frac{\mathrm{Var}[e_i]\mathrm{Var}[e_j]}{(\mathrm{Var}[e_i]\mathrm{Var}[e_j] - \mathrm{Cov}[e_i, e_j]^2)^2}}}$$

$$R_{ij} = -\frac{-\frac{\mathrm{Cov}[e_i, e_j]}{\mathrm{Var}[e_i]\mathrm{Var}[e_j] - \mathrm{Cov}[e_i, e_j]^2}}{\frac{\sqrt{\mathrm{Var}[e_i]\mathrm{Var}[e_j]}}{\mathrm{Var}[e_i]\mathrm{Var}[e_j] - \mathrm{Cov}[e_i, e_j]^2}}$$

But we know that:

$$\Theta_{ij} = -\frac{\mathrm{Cov}[e_i, e_j]}{\mathrm{Var}[e_i]\mathrm{Var}[e_j] - \mathrm{Cov}[e_i, e_j]^2}$$

$$R_{ij} = -\frac{-\mathrm{Cov}[e_i, e_j]}{\sqrt{\mathrm{Var}[e_i]\mathrm{Var}[e_j]}}$$

$$R_{ij} = \frac{\mathrm{Cov}[e_i, e_j]}{\sqrt{\mathrm{Var}[e_i]\mathrm{Var}[e_j]}}$$

let us rearrange this equation:

$$\mathrm{Cov}[e_i, e_j] = R_{ij}\sqrt{\mathrm{Var}[e_i]\mathrm{Var}[e_j]}$$

Then we know:

$$\theta_{ij} = -\frac{\mathrm{Cov}[e_i, e_j]}{\mathrm{Var}[e_i]\mathrm{Var}[e_j] - \mathrm{Cov}[e_i, e_j]^2}$$

$$\theta_{ij} = -\frac{R_{ij}\sqrt{\mathrm{Var}[e_i]\mathrm{Var}[e_j]}}{\mathrm{Var}[e_i]\mathrm{Var}[e_j] - \mathrm{Cov}[e_i, e_j]^2}$$

let us have R_{ij} in the LHS:

$$R_{ij} = -\frac{\theta_{ij}\text{Var}[e_i]\text{Var}[e_j] - \text{Cov}[e_i, e_j]^2}{\sqrt{\text{Var}[e_i]\text{Var}[e_j]}}$$

we know θ_{ii} and Θ_{jj} as:

$$\theta_{ii} = \frac{\text{Var}[e_i]}{\text{Var}[e_i]\text{Var}[e_j] - \text{Cov}[e_i, e_j]^2}$$

$$\theta_{jj} = \frac{\text{Var}[e_j]}{\text{Var}[e_i]\text{Var}[e_j] - \text{Cov}[e_i, e_j]^2}$$

let us multiply the two:

$$\theta_{ii}\theta_{jj} = \frac{\text{Var}[e_i]\text{Var}[e_j]}{(\text{Var}[e_i]\text{Var}[e_j] - \text{Cov}[e_i, e_j]^2)^2}$$

we the proceed to find the square root of the product:

$$\sqrt{\theta_{ii}\theta_{jj}} = \frac{\sqrt{\text{Var}[e_i]\text{Var}[e_j]}}{\text{Var}[e_i]\text{Var}[e_j] - \text{Cov}[e_i, e_j]^2}$$

Let us rearrange the equation:

$$\text{Var}[e_i]\text{Var}[e_j] - \text{Cov}[e_i, e_j]^2 = \frac{\sqrt{\text{Var}[e_i]\text{Var}[e_j]}}{\sqrt{\theta_{ii}\theta_{jj}}}$$

We can then proceed and replace this in the equation for R_{ij}:

$$R_{ij} = -\frac{\theta_{ij}\frac{\sqrt{\text{Var}[e_i]\text{Var}[e_j]}}{\sqrt{\theta_{ii}\theta_{jj}}}}{\sqrt{\text{Var}[e_i]\text{Var}[e_j]}}$$

This simplifies to:

$$R_{ij} = -\frac{\theta_{ij}}{\sqrt{\theta_{ii}\theta_{jj}}}$$

We have therefore shown that $R_{ij} = -\frac{\Theta_{ij}}{\sqrt{\Theta_{ii}\Theta_{jj}}}$.

2. (15 points) From the above result and the relation between independence and correlation, we know

$$\Theta_{ij} = 0 \iff R_{ij} = 0 \implies X_i \perp X_j \mid X_{-ij}$$

Note the last implication only holds in one direction. Now suppose $X \sim N(\mu, \Sigma)$ is jointly Gaussian. Show that $R_{ij} = 0 \implies X_i \perp X_j \mid X_{-ij}$.

$$R_{ij} = -\frac{\Theta_{ij}}{\sqrt{\Theta_{ii}\Theta_{jj}}}.$$

If $R_{ij} = 0$, then $\Theta_{ij} = 0$.

For a jointly Gaussian distribution, the inverse covariance matrix $\Theta = \Sigma^{-1}$ encodes conditional independence. Specifically:

$$\Theta_{ij} = 0 \iff X_i \perp X_j | X_{-ij}.$$

This is because the off-diagonal elements of Θ represent the conditional dependence between variables after accounting for all other variables.

Since $R_{ij} = 0$ implies $\Theta_{ij} = 0$, it follows that:

$$X_i \perp X_j | X_{-ij}.$$

3 Exact Inference - Variable Elimination

Reference materials for this problem:

- Jordan textbook Ch. 3, available at `https://people.eecs.berkeley.edu/~jordan/prelims/chapter3.pdf`
- Koller and Friedman (2009, Ch. 9 and Ch. 10)

3.1 Variable elimination on a grid [10 points]

Consider the following Markov network:

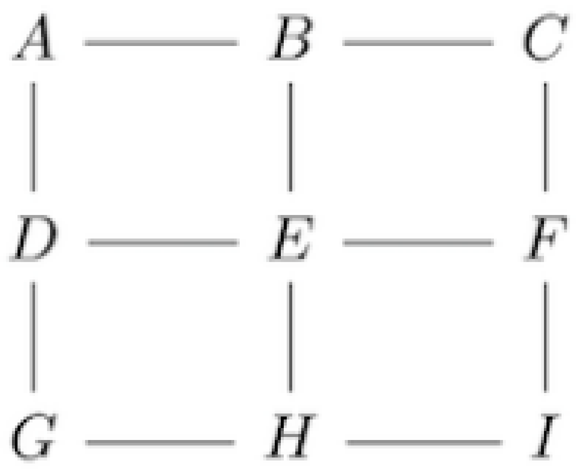

Figure 4: Markov Network

We are going to see how tree-width, a property of the graph, is related to the intrinsic complexity of variable elimination of a distribution

1. (5 points) Write down largest clique(s) for the elimination order $E, D, H, F, B, A, G, I, C$.
   We start by eliminating E, its neighbors are D, F, H, B, so the clique here is :$\{D, F, H, B\}$. size: **4**
   We then eliminate D, its neighbors are A, B, F, G, H, so the clique here is: $\{A, B, f, G, H\}$. size: **5**
   We then eliminate H, its neighbors are G, A, I, B, F, so the clique here is: $\{G, A, I, B, F\}$. size: **5**
   We then eliminate F, its neighbors are A, B, c, G, I, so the clique here is: $\{A, B, C, G, I\}$. size: **5**
   We then eliminate B, its neighbors are A, C, G, I, so the clique here is: $\{A, C, G, I\}$. size: **4**
   We then eliminate A, its neighbors are C, G, I, so the clique here is: $\{C, G, I\}$. size: **3**
   We then eliminate G, its neighbors are C, I, so the clique here is: $\{C, I\}$. size: **2**
   We then eliminate I, its neighbors are C, so the clique here is: $\{C\}$. size: **1**
   The largest clique(s) for the elimination order $E, D, H, F, B, A, G, I, C$ is **5**

2. (5 points) Write down largest clique(s) for the elimination order $A, G, I, C, D, H, F, B, E$.
   We start by eliminating A, its neighbors are D, B, so the clique here is: $\{D, B\}$. size: **2**
   We then eliminate G, its neighbors are D, H, so the clique here is: $\{D, H\}$. size: **2**
   We then eliminate I, its neighbors are H, F, so the clique here is: $\{H, F\}$. size: **2**
   We then eliminate C, its neighbors are F, B, so the clique here is: $\{F, B\}$. size: **2**
   We then eliminate D, its neighbors are H, B, E, so the clique here is: $\{H, B, E\}$. size: **3**
   We then eliminate H, its neighbors are F, B, E, so the clique here is: $\{F, B, E\}$. size: **3**
   We then eliminate F, its neighbors are B, E, so the clique here is: $\{B, E\}$. size: **2**
   We then eliminate B, its neighbors are E, so the clique here is: $\{E\}$. size: **1**
   The largest clique(s) for the elimination order $A, G, I, C, D, H, F, B, E$ is **3**

3. (5 points) Which of the above ordering is preferable? Explain briefly.
   The second ordering is preferable because it results in a smaller largest clique size (3) compared to the first ordering (5). A smaller clique size generally leads to more efficient computations in variable elimination algorithms.

4. (10 points) Using this intuition, give a reasonable ($\ll n^2$) upper bound on the tree-width of the $n \times n$ grid.
   The tree-width of an $n \times n$ grid is at most $2n - 2$. This is because the grid can be decomposed into a tree structure where each node has at most $2n - 2$ neighbors. This upper bound is reasonable and much smaller than n^2, which would be the case for a fully connected graph.
